

Firewall and Network Policy Management for Hybrid Enterprise Environments

FireMon’s mission is to improve security operations to drive superior security outcomes. Trusted by over 1,700 enterprises across nearly 70 countries, FireMon provides industry-leading solutions for security policy management, cloud security operations, and cybersecurity asset management.

Our industry-leading firewall and network policy management platform stands alone as the only real-time solution designed to identify and mitigate risk, automate policy changes, and ensure compliance with ease. FireMon’s Cloud Defense is the exclusive distributed cloud security operations solution that proactively detects and addresses issues in dynamic public cloud environments like AWS and Azure. Additionally, our cloud-based cybersecurity asset management solution provides a comprehensive view of your enterprise infrastructure—scanning on-premises networks and cloud environments alike to uncover every asset and deliver actionable insights into their interconnections. Discover more at [FireMon.com](https://www.firemon.com).

Solutions From FireMon

Security Policy Management

FireMon delivers consolidated security policy management for firewalls and cloud security groups to meet compliance standards, automate policy changes, and minimize risk. Since creating the first-ever policy management solution in 2001, FireMon has grown to become the industry’s only real-time security policy management solution delivering complete visibility and control across an organization’s entire IT landscape.

Cloud Security Operations

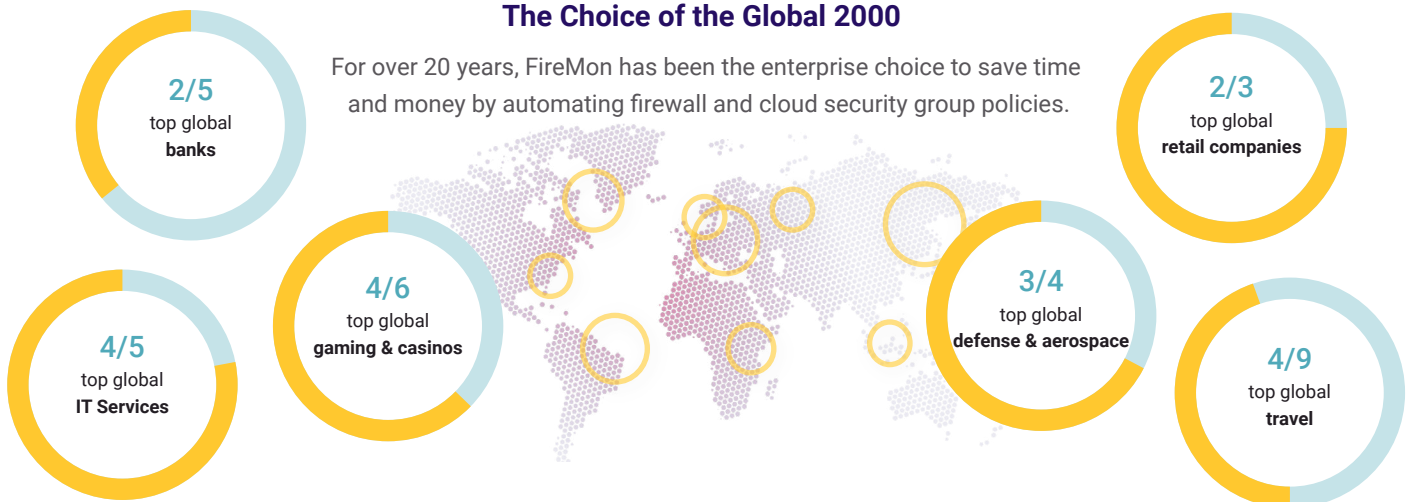

Monitor, alert, and respond to security risks in real-time and provide just-in-time access to your public cloud infrastructure. Now with proactive IAM defense.

Cybersecurity Asset Management

Eliminate leak paths and improve visibility by finding and securing unknown, rogue, and shadow clouds, network infrastructure, and endpoints.

The Choice of the Global 2000

For over 20 years, FireMon has been the enterprise choice to save time and money by automating firewall and cloud security group policies.

FireMon Products

FireMon Policy Manager

FireMon Policy Manager is a comprehensive network security policy management platform that helps organizations quickly adapt to change, manage risk, and achieve continuous compliance. By standardizing and consolidating firewall, cloud security group, and other network policy device rulesets into a single management console, FireMon Policy Manager gives network teams visibility and control over even the most complex hybrid networks with ease. Designed with enterprise needs in mind, Policy Manager is highly scalable and highly customizable with industry's only API-first approach that exposes every control for quick and reliable integrations.

FireMon Insights

FireMon Insights is a cloud-based add-on to FireMon Policy Manager designed to provide cybersecurity leaders with actionable visibility into firewall policy management. By integrating advanced analytics, executive dashboards, and an AI-powered chat interface, Insights helps organizations measure and demonstrate the value of their firewall security efforts with clarity and precision.

Change Management

The FireMon Change Management module introduces change workflow solutions to FireMon Policy Manager, automating the entire change management process. Comprehensive rule lifecycle management enables security and operations teams to implement the right changes with precision across the entire rule lifecycle with fully customizable workflows. The Change Management module assesses the risk associated with new access requests in real time, giving teams the ability to immediately detect when changes will create new vulnerabilities or increase the threat surface.

Rule Recertification

FireMon's Rule Recertification module gives Policy Manager the capability to automate rule review and maintenance workflows, helping to maintain continuous compliance and minimize the threat surface. It takes the guesswork out of network security policy management by ensuring that existing firewall rules are reviewed in accordance with compliance, business, and security policies. Using event-based triggers or search query results generated within Policy Manager, the Rule Recertification module automatically creates and sends tickets to policy owners to take action.

Vulnerability Management

The Vulnerability Management module adds best-in-class vulnerability management to Policy Manager by incorporating third-party vulnerability scanner data to evaluate network policy risk and uncover potential attack paths across the entire environment. The Vulnerability Management module simulates potential attacks, calculates attack vectors, and assesses potential damage, then displays results in a comprehensive and intuitive user dashboard. Extensive scenario testing helps prioritize vulnerability patching by allowing security teams to simulate patch deployments to determine their impacts to the overall network risk posture.

FireMon Asset Manager

FireMon Asset Manager (formerly Lumeta) is a real-time network visibility solution that monitors hybrid cloud environments for anomalies, potential threats, and compliance violations. It continuously scans and discovers the entire network infrastructure for every device and connection including firewalls, routers, end points, and cloud devices. Using advanced behavioral detection techniques, Asset Manager builds a baseline of network patterns and alerts security teams when suspicious activities or compliance violations are detected.
