

Pin Down the Cloud

Instant visibility, continuous security for the enterprise cloud

THE CHALLENGE: Visualize the cloud and orchestrate cloud security with absolute precision.

Clouds expand. That's just what they do. Clouds encircle the globe, they become dense, they thin out. Clouds are amorphous, clouds move unpredictably.

Cloud security must meet this challenge. Clouds are, well... cloudy. It can be difficult to clearly see what security you have and what's needed to defend data in the enterprise cloud.

With each new application, cloud instance or S3 bucket, enterprises incrementally decrease line-of-sight. Without a firm grasp of where you are, it is impossible to see which direction to go.

Specific challenges include:

- Unknown security controls (native and bolted-on)
- Inconsistent rules and standards across multiple clouds
- Trouble keeping pace with cloud adoption
- Compliance is virtually non-existent

THE SOLUTION: Central Command for All Cloud Security Controls

FireMon gives you cloud control. With a central place to visualize your cloud security controls, you have an inventory to analyze and improve your cloud security posture.

Unlike other attempts at cloud security, FireMon goes beyond web-enabled firewalls by reaching deep into your native cloud security controls, like AWS Security Groups and individual VPCs, to uncover weaknesses and orchestrate change. All from a single FireMon console.

This centralized management station puts you in control of your cloud and automates change to keep pace with rapid cloud adoption.

WHY FIREMON?

Intelligent Policy Automation safely and effectively command security policies and reduce risk in your cloud

Performance at Scale from a single console, you are in control of your private, public and hybrid clouds

Log Analysis confirm your cloud controls with real-time analytics of users, data, apps and communication in your cloud

Open APIs

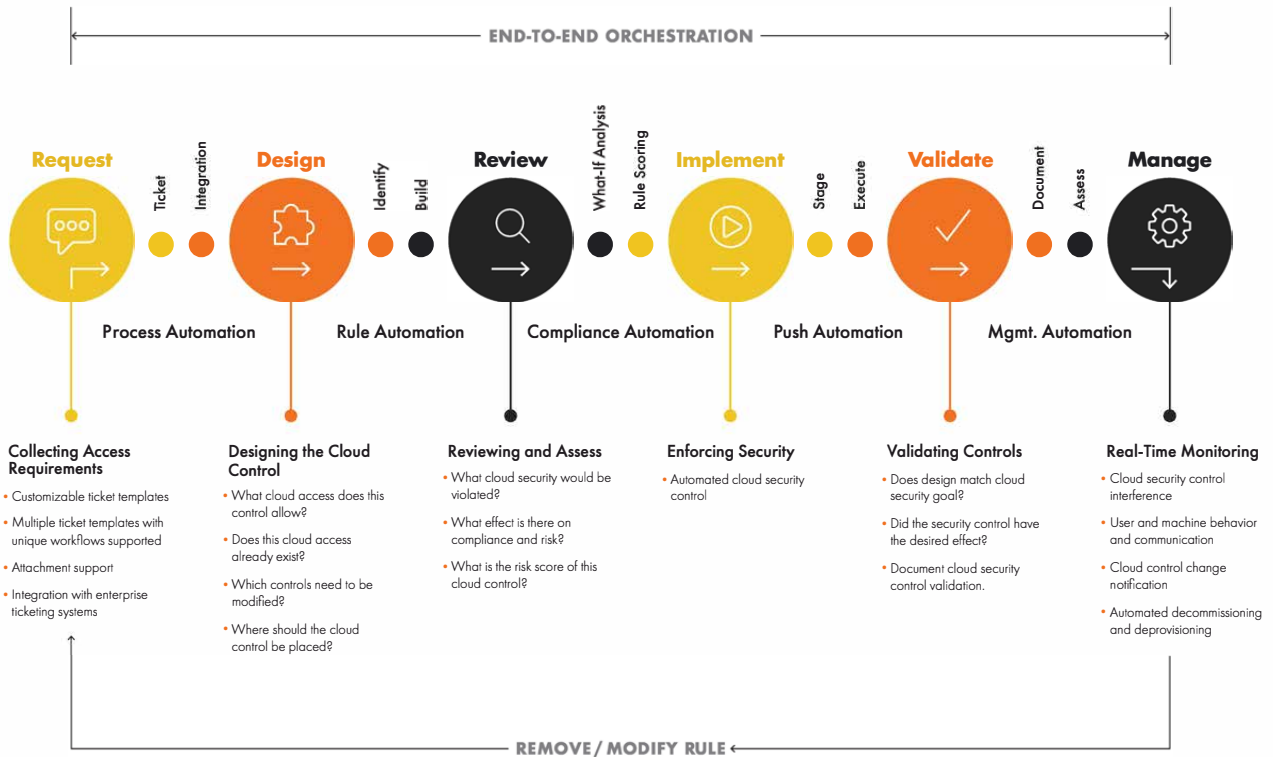

Only FireMon puts you in direct control of your cloud's security and VPCs. Robust APIs give you deep integration – in public, private and hybrid clouds – for total, centralized visibility and orchestration.

Real-Time Monitoring

With granular and up-to-the-second views into the cloud infrastructure, FireMon provides instant analysis and alerts when changes are detected.

INTELLIGENT POLICY AUTOMATION

FireMon's Intelligent Policy Automation (IPA) framework is the only solution that safely and effectively ensures policy automation needs are met while reducing an organization's risk posture.

Reduce Time

Automate and orchestrate cloud controls in minutes instead of weeks.

70%
reduced time for cloud control changes

Cloud Security Assurance

Ongoing, continuous security checks throughout your public, private and hybrid clouds.

100%
cloud configuration assurance

1

Console for Every Cloud

Native Cloud Control

Command security to every last cloud security control and VPC from a single FireMon console.

90%
time saved on audit prep

Audit Prep Time

When all cloud controls are matched to compliance standards, your cloud is always audit-ready.
